EDUCATION

University of Maryland, College Park
Bachelor of Science in Computer Science

Aug. 2021 – May 2025
College Park, MD

EXPERIENCE

Samsara

Software Engineer

Aug. 2025 – Present

San Francisco, CA

- Built an LLM-powered pull request review and auto-approval system for a large engineering monorepo that now merges 35% of all PRs with no human reviewer, removing review wait as a bottleneck for a third of the organization's code changes.
- Designed an agentic evaluation harness replaying curated datasets of real production PRs against configurable agent backends, making review quality measurable and enabling rapid iteration on prompts and models.
- Scaled the reviewer from a pilot allowlist to every PR in the organization using whole-file review context, cross-push deduplication of repeat findings, severity-tiered annotations, and an engineer feedback loop, kept safe by deterministic guardrails for code coverage, high-risk alerting, and per-team approval policies.
- Shipped an emergency deployment workflow on the internal deploy platform, adding non-mainline branch builds and one-click rollback for failed pipelines to cut time-to-mitigate during production incidents.

Amazon Web Services

Software Development Engineering Intern

June 2024 – Aug. 2024

Sunnyvale, CA

- Reduced inefficient resource usage by 20% by developing an AWS-based application to automatically identify and reclaim idle resources in a distributed computing service, with CI/CD pipelines for rapid iteration and deployment.
- Designed a customer-facing reporting system using React and AWS, enabling users to visualize resource utilization data with advanced filtering and remediate inefficiencies themselves.
- Architected serverless solutions using AWS Lambda, DynamoDB, and API Gateway, scaled to thousands of concurrent requests.

Vesta Technologies LLC.

Founder / Fullstack Software Developer

Aug. 2020 – May 2022

Chantilly, VA

- Spearheaded a cross-functional team of 5 engineers to deliver a SaaS desktop application using Python, React.js, and Go, optimizing e-commerce checkout workflows and generating over \$500,000 in gross revenue.
- Reverse-engineered Akamai WAF by analyzing JavaScript-based security mechanisms, developing custom TLS request clients in Python and Go to simulate legitimate user traffic.
- Trained a TensorFlow neural network generating realistic mouse movement telemetry fingerprints, mimicking human behavior with 98% accuracy.
- Architected a scalable microservices backend on AWS using EC2, S3, RDS, Lambda, and Express to support over 200 concurrent users.

PROJECTS

Auctionball | *TypeScript, Node.js, WebSockets, PostgreSQL, Render*

2026 – Present

- Built and shipped a live head-to-head basketball auction game with over 25,000 games played, in which two players bid to draft a five-man squad from the all-time greats, then a possession-based Monte Carlo simulator, calibrated against real NBA stat distributions, decides the winner.
- Engineered a synergy model scoring spacing, playmaking, and switchability that beats raw star power over 60% of the time, plus WebSocket matchmaking with bot fallback, reconnects, and a daily win-streak leaderboard.

Journeyman | *Python, FastAPI, Go, TypeScript, SQLite, Claude API*

2026 – Present

- Built an open-source Python library that turns any LLM agent into a self-learning system in two lines of integration code, with a single decorator tracing every run: inputs, outputs, tool calls, tokens, cost, latency, and errors.
- Designed an eval gate so a lesson learned from user feedback only stays live while the eval suite's pass rate holds and rolls back automatically when it does not, backed by YAML eval suites, seven scorer types including LLM-as-judge, and an embedded SQLite store or HTTP server for cross-process tracing.

TECHNICAL SKILLS

Languages: Go, TypeScript, JavaScript, Python, Java, SQL, HTML/CSS, Ruby, Rust, OCaml, C++, Kotlin, Bash

Frameworks: React, Next.js, Node.js, Express, GraphQL, gRPC, Flask, FastAPI, Django, WebSockets/Socket.IO, React Native, Electron, Tailwind, Webpack, Vite, pytest

AI/ML: Claude API, OpenAI API, LLM agents, agent evaluation harnesses, TensorFlow, Keras, OpenCV

Cloud & Tools: AWS (Lambda, DynamoDB, API Gateway, AppSync, S3, EC2), Firebase, Postgres, MySQL, MongoDB, Redis, Docker, CI/CD, GitHub Actions, Jenkins, Linux, OAuth, Git, Figma, Jira, Notion, Confluence
